Introduction:

SportBuzz is a dynamic web application designed to cater to sports enthusiasts by providing real-time match scores and up-to-date sports news articles. This platform not only keeps users informed about their favourite sports and teams but also offers a personalized experience by allowing users to manage their preferences and profile settings.

Objectives:

- 1. **Real-Time Updates:** To provide users with the latest match scores and detailed information about ongoing and past matches.
- 2. **News and Articles:** To offer a wide range of sports-related news articles, ensuring users stay informed about developments in the sports world.
- 3. **User Personalization:** To enhance user experience through profile management and customization of sports and team preferences.
- 4. **Responsive Design:** To ensure accessibility and a seamless user experience across various devices and screen sizes.
- 5. **Security:** To implement secure authentication mechanisms for user sign-in and sign-up processes.

Features:

1. User Authentication:

- Secure sign-in and sign-up functionalities.
- Token-based authentication to protect user data and sessions.

2. Profile Management:

- Allows users to view and update their profile information.
- Enables users to change their password securely.

3. Preferences:

- Users can select and manage their favorite sports and teams.
- Personalized content based on user preferences.

4. Match Scores:

- Displays real-time match scores and details.
- Users can view information about specific matches through dedicated match pages.

5. News Articles:

- Provides access to the latest sports news articles.
- Users can read detailed articles on specific sports events and topics.

6. Responsive Design:

 Ensures the application is accessible and usable on desktops, tablets, and mobile devices.

7. Progressive Web App (PWA) Features:

 Offline capabilities and faster load times for an enhanced user experience.

Technologies and Libraries:

1. React and Related Libraries:

- **react**: A JavaScript library for building user interfaces.
- **react-dom**: Provides DOM-specific methods that can be used at the top level of a web app to enable an efficient way of managing DOM elements.
- **react-hook-form**: A library for handling form validation in React applications.
- **react-router-dom**: A library for handling routing in React applications.

2. UI Components and Styling:

- **@headlessui/react**: A set of completely unstyled, fully accessible UI components, designed to integrate beautifully with Tailwind CSS.
- **@heroicons/react**: A set of free, MIT-licensed high-quality SVG icons for you to use in your web projects.
- **@tailwindcss/line-clamp**: A plugin for Tailwind CSS that provides utilities for truncating text.

Types:

- **@types/jest**: TypeScript definitions for Jest.
- @types/react: TypeScript definitions for React.
- @types/react-dom: TypeScript definitions for React DOM.
- **@types/node**: TypeScript definitions for Node.js.
- **typescript**: A language that builds on JavaScript by adding static type definitions.

4. PostCSS and Tailwind CSS:

- **postcss-cli**: A tool for using PostCSS from the command line.
- **postcss**: A tool for transforming CSS with JavaScript plugins.
- **postcss-preset-env**: A plugin that allows you to use future CSS features today.

• **tailwindcss**: A utility-first CSS framework for rapidly building custom user interfaces.

5. PWA Support:

• **vite-plugin-pwa**: A Vite plugin for creating Progressive Web Applications (PWA).

DevDependencies

1. Build Tools:

- **vite**: A build tool that aims to provide a faster and leaner development experience for modern web projects.
- @vitejs/plugin-react: A Vite plugin for React.

2. Linting and Formatting:

- **eslint**: A tool for identifying and fixing problems in JavaScript code.
- **eslint-plugin-react**: An ESLint plugin for React.
- **eslint-plugin-react-hooks**: An ESLint plugin for enforcing rules of hooks in React.
- **eslint-plugin-react-refresh**: An ESLint plugin for React Refresh.

3. Autoprefixing:

• **autoprefixer**: A PostCSS plugin that parses CSS and adds vendor prefixes to CSS rules.

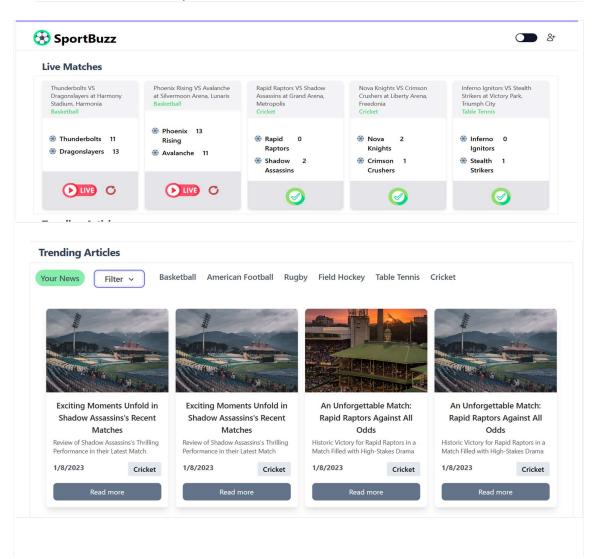

Technologies and Libraries:

- > **React:** For building the user interface.
- > **React Router:** For handling client-side routing.
- **React Hook Form:** For form management and validation.
- > **Headless UI & Heroicons:** For accessible and unstyled UI components and icons.
- > **Tailwind CSS:** For styling using a utility-first CSS framework.
- > Vite: For development and build processes.
- > **TypeScript:** For static typing, ensuring better code quality and maintainability.
- **ESLint:** For linting and maintaining code quality.
- > Vite Plugin PWA: For adding PWA features.

Home Page of SportBuzz Application:

The **Home** component serves as the main page for displaying live matches and trending articles. It uses lazy loading to optimize performance by loading the **Match List** and **Articles List** components only when needed. The **Error Boundary** component is used to catch and display errors that might occur during the rendering of these components.

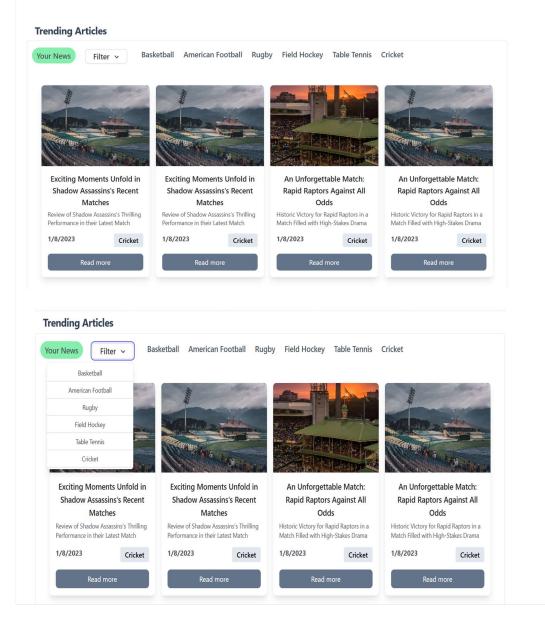

- The navigation bar includes the application name SportBuzz and provide options for user sign-in and sign-up
- The landing screen should have a section for live scores, displaying the last five latest scores available in the application.
- The trending news section should include tabs for each sport, allowing users to view news articles specific to each sport.
- The trending article view should showcase the most popular or trending articles across all sports.

Filter Layout:

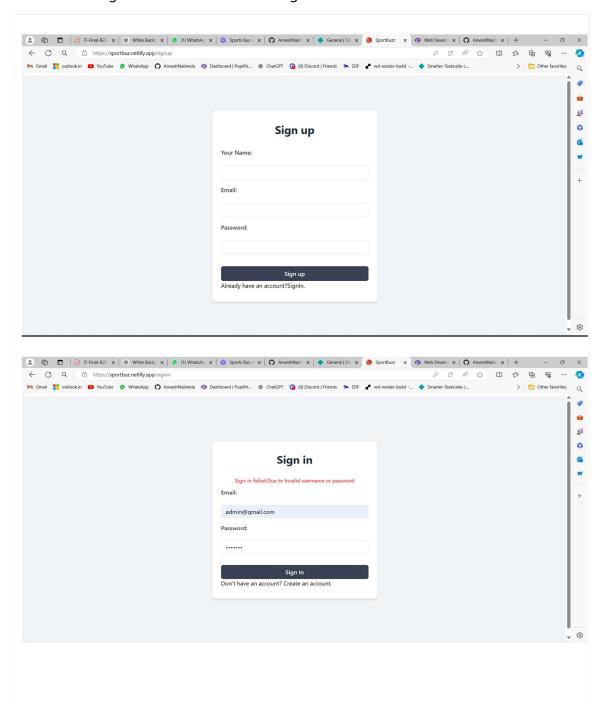

The filter layout enables users to select a sport and choose a team within that sport.

The selected filters used to display news articles relevant to the chosen sport and team.

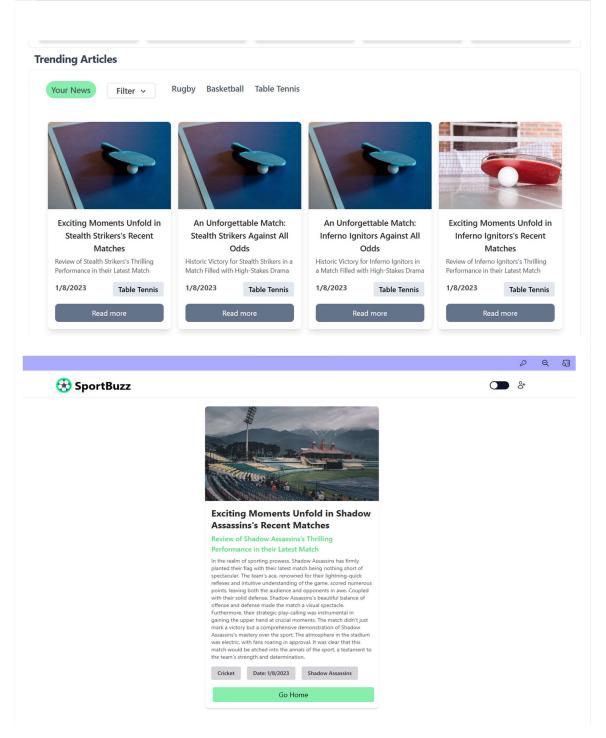

Sign-in and Sign-up Pages:

- The sign-in and sign-up pages should be accessible from the navigation bar icon on the landing page.
- Users should be able to register and create an account if they are new to the application.
- Existing users should be able to sign in to their accounts.

Detailed News Article View:

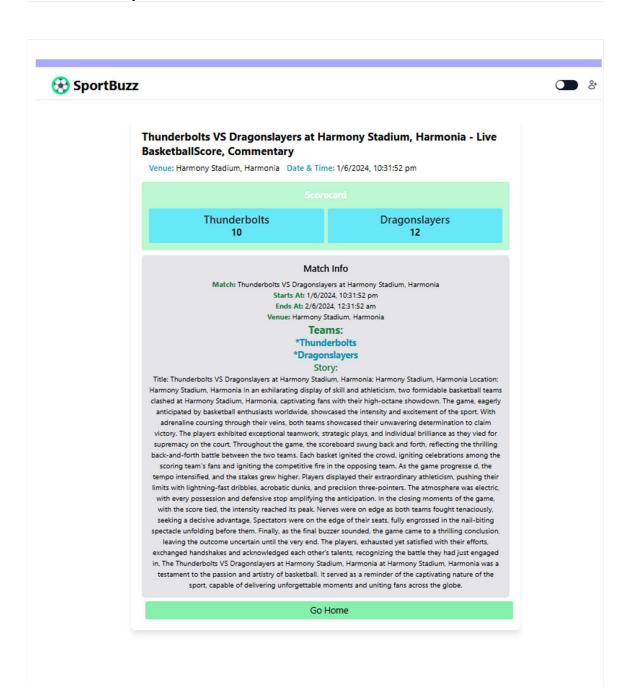

- Clicking on the Read More icon or text on a news article should open a pop-up or modal dialogue.
- The pop-up should display a detailed view of the news article, including an image and relevant content.

Detailed Match View:

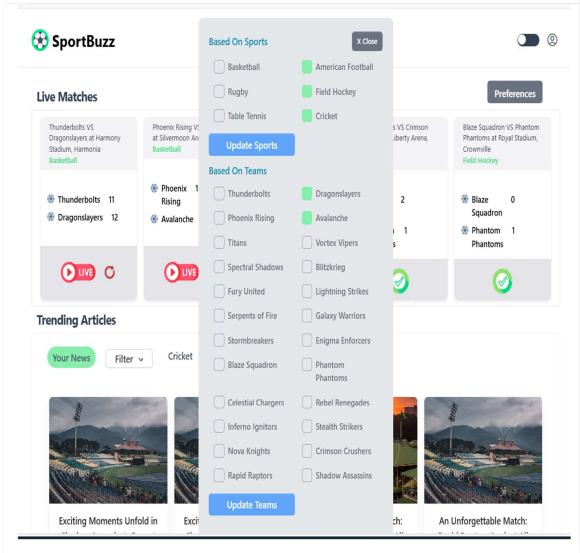

- when a user clicks on a match, they are taken to a detailed view of that match, identified by the match's ID in the URL.
- The component displays various pieces of match information such as the match name, sport name, venue, date and time, scores for each team, and additional match details.

It also includes a scorecard and a section for match information, including teams and the match story.

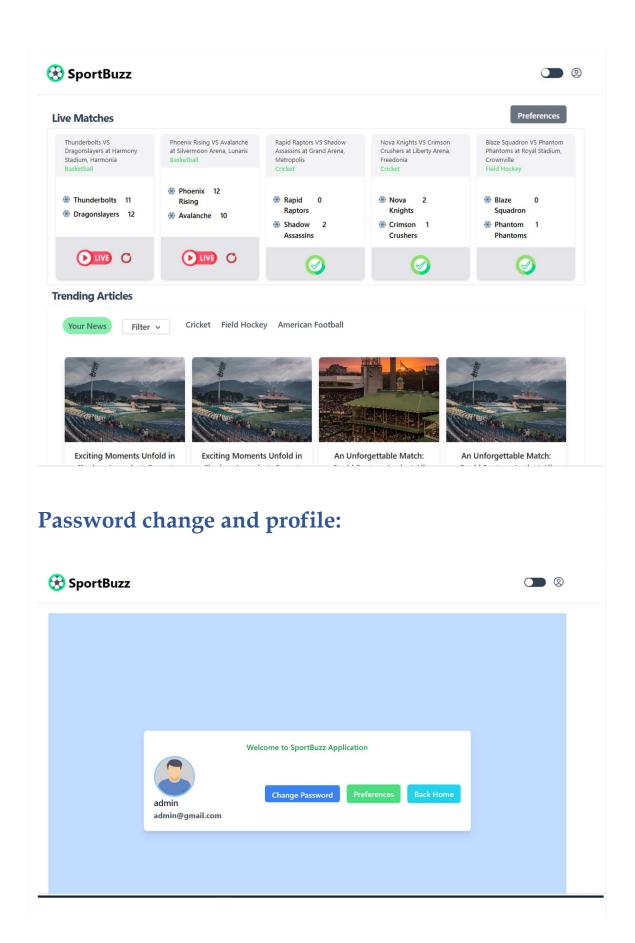

Preferences Screen:

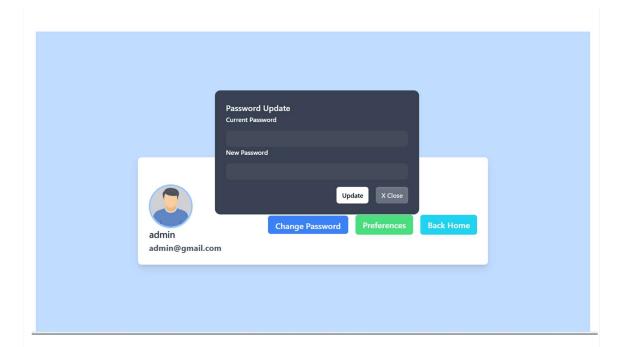

- The preferences screen should be accessible from the landing page as a popup or modal dialogue.
- Users should have the ability to select the sports they want to receive news articles from.
- Users should be able to choose specific teams they are interested in and want to read articles about.

Filtering Based on User Preferences:

- When a user is logged in, the application should filter news articles based on their selected preferences.
- Only articles related to the chosen sports and teams should be displayed to the user.

Dark theme:
